```

**RUSSIAN WORDS**

**SWEET-EXPRS**

russian-lang

The screenshot shows the title page of the Russian Racket manual. At the top left is a search bar with the text "...search manuals...". To its right is the version number "v.8.6". In the top right corner is the Racket logo and the word "Racket". The main title is "Русский язык программирования" in a large, bold, black serif font. Below the title is the author information: "by Клочков Роман <kalimehtar@mail.ru>". A light blue horizontal bar contains the text "#lang 1" on the left and "package: russian-lang" on the right. The main body of text describes the manual's purpose: "Это руководство описывает русскоязычный язык программирования, основанный на идеях из расширения синтаксиса Scheme [readable](#)." Below this, it states: "Семантика языка на данный момент полностью унаследована от Racket, вплоть до полной обратной совместимости: из этого языка можно вызывать любые функции и синтаксические конструкции Racket, а из Racket можно вызывать модули на этом языке." On the left side, there is a dark grey sidebar with a search bar and a list of navigation links: "top", "← prev", "up", "next →", "▶ Русский язык программирования", "Русский язык программирования", "1 Отличия от Racket", "2 Основы языка", "2.1 Простые значения", "2.2 Выражения", and "2.3 Основы определений".

### The Budge programming language

Budge-PL (bʌdʒ, b'dʒh) is an esoteric programming language. It uses Gödel numbering to represent registers and their values by relying on the Fundamental Theorem of Arithmetic (prime factorization). The language uses similar constructs as [FRACTRAN](#), however, it provides a more convenient way to construct loops and uses integers rather than fractions to denote instructions. It also abstracts prime

Search **H:** for haslangs

v.8.6

## Search Manuals

You are searching all available Racket packages, including those that you may not have installed locally. Therefore, you may need to install a package to use the results shown below. [Getting Started with Packages](#) guides you through this process. If you want to re-run your search with local results only, press F1 in DrRacket or run `raco docs` on the command line.
